• Write dictionary queries and synchronize with the server. • DictProtocol is a communication protocol for exchanging messages between an application client and the dictionary server. It is based on a publish/subscribe model, in which messages are exchanged between two messaging agents. • Dictionaries are based on simple rules for mapping between natural language terms and numerical values. The dictionaries follow a simple vocabulary list and a simple grammar. • For example, "subtract the value from the target" will result in the following HTTP (tcp/ip) request, DictRequest Cognitive Server API is a standard method for integrating machine learning into your corporate applications, and ensuring the relevance of results for the user. This Intelligent Programmable Info Retrieval api/SDK can be integrated into all OSS platforms including Microsoft Windows, Java, and .NET, and be used to improve all applications. A Ruby SDK is also available. AbpQuickLinks is an ActiveX which will work as an ActiveX control that will allow you to add the "sorting" feature to your web pages. The ActiveX will allow the user to click on a link to sort the result list according to the links you provide. Sorting can be in any order. The options are alphabetical, numerical or date-based. This ActiveX also contains a download button to download the source code so you can customize as you like. AbpQuickLinks is available under the terms of the new GNU GPL V3.0 license License: GNU GPL version 3 (GNU GPLv3) Size: 16 Kb AjaxCrud is a open source API which will allow you to add the CRUD functionality to your web pages. The AjaxCrud API contains all the functionality you need to create, edit, read and delete rows and display the results. It is a REST API which can be used to enable cross-platform compatibility. The only additional thing you need to do to use this API is to add the following code to your page header License: GPL v3 Size: 11 Kb AjaxCrud is a open source API which will allow you to add

What's New in the?

The eXDictClient ActiveX control is a text-based HTML form-based search engine (search index). eXDictClient will allow you to quickly find text from any of your installed dictionaries and engines. You can use eXDictClient to not only find the definition for a given word, but to also perform a database query. The search results can be displayed as a list of the most frequently used entries or as a formatted table. eXDictClient is designed to facilitate the use of a wide variety of searching engines, also known as dictionaries, including standard Microsoft Windows and SharePoint dictionaries, Web dictionaries, external HTTP dictionaries, Wikipedia, and many more. The data stored by eXDictClient is XML based, making it easy to transfer to many different applications. eXDictClient is not a native component of your operating system; it is an ActiveX component that requires the addition of the eXDictClient component in the Project Properties for your web or desktop application. If you are developing a web application, you may want to use the eXDictClient site search. You may also want to use the eXDictClient web service. eXDictClient uses the exact same dictionary protocol used by the MS Excel Dictionaries protocol extension. You can even use the Microsoft Word Format data protocol in your own applications. The eXDictClient site search uses the exact same protocol. eXDictClient (Form Based) Description: eXDictClient allows you to quickly find text from any of your installed dictionaries and engines. eXDictClient will allow you to quickly find text from any of your installed dictionaries and engines.
