Q: Determine a decomposition of a triangle which is symmetric in the bases Here is a question from an old book: Let ABC be a triangle, and let D be a point on BC such that AD is perpendicular to BC . Let M be the midpoint of AB and let N be the midpoint of AC . Determine a decomposition of ABC into triangles, each of which is symmetric in the bases. Now I know that the exterior angle bisectors are the lines joining the midpoints of opposite sides. But I do not know how to apply them here. Am I misunderstanding the question? Or is there a direct solution? Thanks for any helps. A: Draw AO , BO , and CO , AO , BO , and CO perpendicular. First build BM and CM so that $AQ = CM$ and $AM = BM$. Then cut BQ by AO , CO by AO That gives you $CQ = BC + BM$, $BC = CQ - BM$. Then CQ is parallel to BC . Now cut AQ by BO , BC by CQ That gives you AC parallel to BO . And AC is parallel to BC .
