Nitro Pro 9 allows you to quickly create, convert, merge, edit, sign, and share 100% industry standard PDF files for superior results and savings. Nitro Pro is a powerful set of tools that allows you to work with digital content, including creating PDFs, merging, converting, editing, and signing PDF files. Nitro Pro can create PDF files using its own internal engine, providing superior document quality and readability, as well as full-featured support for most formats: PDF, TXT, PPT, DOC, DOCX, XLS, XLSX, CSV, PSD, TIFF, JPG, GIF, BMP, PCX, PDB, EMF, WMF, PNG, TGA, HTML and TXT.

When logging, a user may utilize various devices to form the resultant log. Most commonly used devices, such as electric and/or pneumatic tools, include a trigger to control the energy delivery to the device. Thus, when the tool is in an active state and the trigger is depressed, energy is delivered to the tool and causes a button or other operator to actuate. Often times, such tools also include a wireless communication device, such as a radio, to send and/or receive information from another electronic device. Such wireless communications devices typically include a power source, such as a battery, which supplies energy to the radio to activate the radio and allow for a wireless transmission. Thus, when the tool is in an active state and the trigger is depressed, energy is delivered to the wireless communication device, which allows the wireless communication device to send and/or receive information from another electronic device. In certain situations, a user may desire to track the actuation of the trigger on the tool. If the user is in the process of performing a job that requires the use of the tool, the user may not be able to continuously observe the actuation of the trigger. When the trigger is depressed, the resultant energy is delivered to the tool and causes a button or other operator to actuate, and the user may not know when the tool is actuated. As such, the user may be unnecessarily inconvenienced or extended waiting period to perform the task and verify that the tool has been actuated. Alternatively, the user may try and guess when the tool has been actuated and may not be able to quickly identify the location of the tool. The present invention relates to a method for manufacturing a semiconductor device. More specifically, the present invention relates to a method for forming a gate electrode in a semiconductor device, especially a gate electrode formed on a semiconductor substrate and a gate electrode formed on a multilayer interconnection layer stacked on the semiconductor substrate. To form a gate electrode, a gate oxide film and a conductive poly-Si film are formed on a silicon substrate, and then a gate electrode, a gate dielectric film and a field oxide film are formed on the poly-Si film. The gate dielectric film is etched and c6a93da74d
